FORTUNE 500 WANTS TO SIGN

A major enterprise client is ready to sign a significant contract. Their security team has sent a vendor assessment with 80 questions covering uptime SLAs, compliance posture, incident response procedures, and data residency. They want answers within the week.

Enterprise vendor assessments test the maturity of your entire DevOps and security programme in one document. Common questions include: What is your deployment frequency and change failure rate? How do you manage vulnerabilities and patch SLAs? What is your documented RTO/RPO? Can you provide SOC 2 Type II or ISO 27001 certification? How do you handle data residency and processing agreements? Teams with mature DevOps practices — continuous deployment, SLO-driven reliability, automated security controls, and documented incident response — typically complete enterprise assessments in days rather than weeks, because the evidence already exists as operational artefacts. Winning enterprise deals is often the moment organisations recognise that DevOps investment is a revenue driver, not just an engineering preference.

Enterprise revenue is transformative. Enterprise procurement is unforgiving. They have walked away from better products for weaker compliance.

TEAM DISCUSSION

Can you answer 80 security and compliance questions confidently — and back every answer up with documented evidence?
