CI/CD

CONTINUOUS INTEGRATION FROM DAY ONE

Merging code frequently into a shared branch and running automated tests prevents integration hell. Even a simple CI pipeline is not optional — it is the foundation for automated testing, deployment pipelines, security scanning, and quality gates.

KEY BENEFITS

- ✓ Eliminates multi-week integration phases at end of sprint
- ✓ Catches regressions within minutes of introduction, not weeks later
- ✓ Builds shared confidence — everyone knows the main branch is green
- ✓ Creates the foundation for CD, security scanning, and release automation

REAL-WORLD EXAMPLE

Teams practising CI merge multiple times per day. Teams without it often spend the last week of a sprint just getting diverged work to compile together — pure waste that compounds every release.

PRACTICAL EXAMPLE

A developer pushes a small auth fix. Within 90 seconds, CI runs 400 unit tests, a lint check, and a security scan. The build is green. They merge. No integration meeting. No 'it works on my machine'.

REFLECTION QUESTION

How often does your team merge to main? How long does it take to get feedback on a broken build?
