OBSERVABILITY

# IF IT ISN'T MONITORED, IT DOESN'T EXIST

You cannot improve — or defend — what you cannot see. Logs, metrics, and traces from day one mean that when something breaks, you understand why. The three pillars: structured logs (what happened), metrics (how the system performs), distributed traces (where time is spent across services).

KEY BENEFITS

- ✓ Reduces Mean Time to Detect (MTTD) from hours or days to seconds
- ✓ Turns post-mortem investigation from guesswork into evidence
- ✓ Enables proactive alerting before users are impacted
- ✓ Provides the data foundation for SLOs, capacity planning, and performance tuning

REAL-WORLD EXAMPLE

*The DORA research programme found elite teams restore service 2,604× faster than low performers. The single biggest differentiator is observability and automated alerting — not team size or budget.*

PRACTICAL EXAMPLE

*An API endpoint slows from 80ms to 3s. A Grafana alert fires within 60 seconds. The engineer opens a trace and sees 95% of time is in a single database call. The index is added and deployed within the hour.*

REFLECTION QUESTION

*If your most critical service started failing silently right now, how long before anyone noticed?*
