OBSERVABILITY / COMPLIANCE

# IMMUTABLE AUDIT TRAILS

Who changed what, when, and why? Centralised, tamper-evident logging captures every access, deployment, and configuration change. This serves three purposes: debugging mysterious incidents, demonstrating compliance to regulators, and detecting security breaches.

KEY BENEFITS

- ✓ Answers regulatory 'who accessed what' questions in minutes, not days
- ✓ Provides forensic evidence for security incident investigation
- ✓ Enables rapid root cause analysis for mysterious production failures
- ✓ Demonstrates continuous compliance rather than point-in-time remediation

REAL-WORLD EXAMPLE

*GDPR requires organisations to demonstrate lawful processing of personal data on demand. Without comprehensive, immutable audit logs this is impossible. Fines reach 4% of global annual revenue.*

PRACTICAL EXAMPLE

*A regulator asks: 'Who accessed customer records between March 1–15?' The compliance team runs one query against the centralised audit log and produces a signed export in 8 minutes. No scramble. The answer was always there.*

REFLECTION QUESTION

*Are your audit logs centralised, tamper-evident, and retained for the period your obligations require?*
