INTERNAL DEVELOPER PLATFORMS (IDPS)

PLATFORM ENGINEERING ENABLES SCALE

As organisations grow, the cognitive load of infrastructure, compliance, and deployment tooling becomes a drag on product velocity. Platform engineering solves this with self-service paved roads: standardised deployment paths, internal developer portals, and automated compliance guardrails.

KEY BENEFITS

- ✓ Product teams ship faster by consuming platform capabilities without deep infra expertise
- ✓ Standardisation reduces security and compliance variance across the estate
- ✓ New engineers become productive in days, not weeks
- ✓ Platform investment scales: one platform team enables tens of product teams

REAL-WORLD EXAMPLE

Spotify's Backstage became open source and is now used by Netflix, LinkedIn, and hundreds of others. Developers spend dramatically less time on infrastructure and more time delivering product value.

PRACTICAL EXAMPLE

A new engineer joins. Instead of a week reading wikis and asking Slack for help, they run one command that scaffolds a fully configured service — with CI, observability, and a first deployment — in 20 minutes.

REFLECTION QUESTION

How much time do your product engineers spend on infrastructure and tooling per week? What would they do with that time back?
