ENGINEERING EFFECTIVENESS / DORA

# THE FOUR KEY DORA METRICS

DORA's four metrics reliably predict software delivery performance. Deployment Frequency: how often you ship. Lead Time for Changes: commit to production. Change Failure Rate: how often deployments cause incidents. Mean Time to Recovery: how quickly you restore service. Elite teams score highly on all four simultaneously.

KEY BENEFITS

- ✓ Provides an objective, industry-benchmarked measure of engineering effectiveness
- ✓ Reveals the specific bottleneck — is it lead time, frequency, or recovery?
- ✓ Correlates directly with business outcomes including revenue growth and market share
- ✓ Creates shared language between engineering and business leadership

REAL-WORLD EXAMPLE

*The DORA State of DevOps report spans 10+ years and 33,000+ respondents. High performers are 2× more likely to exceed profitability and market share goals. DevOps is measurably a growth strategy.*

PRACTICAL EXAMPLE

*The team tracks DORA metrics on a shared dashboard. Lead Time has crept from 2 days to 9 days over three months. They trace it to a growing manual QA queue. Automated end-to-end tests return Lead Time to 2 days within six weeks.*

REFLECTION QUESTION

*Do you know your current Deployment Frequency, Lead Time, Change Failure Rate, and MTTR? Are they improving?*
