DEVOPS / SHARED OWNERSHIP

YOU BUILD IT, YOU RUN IT

When developers own the production health of their features, quality improves dramatically. The team that ships the code should be on the hook when it breaks — this incentive alignment eliminates the 'throw it over the wall to ops' dynamic that causes slow feedback, poor quality, and mutual blame.

KEY BENEFITS

- ✓ Faster incident response — engineers who wrote the code diagnose it fastest
- ✓ Higher build quality — on-call pain creates immediate pressure to fix root causes
- ✓ Fewer handoff delays — no waiting for a separate ops team to investigate
- ✓ Engineers design for operability from day one (logging, alerts, runbooks)

REAL-WORLD EXAMPLE

Amazon pioneered this model in 2006. Teams went from handing off to ops to owning their services end-to-end — faster incident response, higher quality, and engineers who design for operability from the start.

PRACTICAL EXAMPLE

A squad shipping a new checkout flow also owns the on-call rotation for it. When latency spikes at midnight, the engineers who wrote the code are the ones who get paged — and fix it permanently rather than passing it to ops.

REFLECTION QUESTION

Who is responsible when your service goes down at 2am? Is it the same team that wrote the code?
